# About DHCP (1/8)

## □ Dynamic Host Configuration Protocol

- Provide necessary information for a host to access network

  - IP address, gateway, DNS (Domain Name Server), etc.

- A DHCP transaction is completed by 4-way handshake:

## About DHCP (2/8)

9	5.676080125	0.0.0.0	255.255.255.255	DHCP	342	DHCP Discover	-
10	5.677121518	10.1.11.3	10.1.11.25	DHCP	342	DHCP Offer	-
11	5.677344173	0.0.0.0	255.255.255.255	DHCP	342	DHCP Request	-
12	5.678388535	10.1.11.3	10.1.11.25	DHCP	342	DHCP ACK	-
13	6.197545870	02:eb:cf:c1:c2:89	LLDP_Multicast	LLDP	130	TTL = 120	-

# Outline

- ☐ About DHCP
- ☐ Project 6 Requirements
- ☐ Hints

## Project 6 Requirement

❑ In this project, you need to implement a **unicast DHCP application** that support:

1. Dynamically set DHCP server's connect point through REST API (configuration service).
2. Compute path between DHCP client and DHCP server.
3. Install flow rules to forward DHCP transaction traffic.

## Project 6 Requirement - Workflow (1/7)

1. Before DHCP transaction
  - a. Network manager upload configuration file to ONOS
  - b. Your application should install a flow rule to request DHCP packets
2. DHCP DISCOVER will be packet-in to controller by switch
3. Controller compute path between DHCP client and server
4. Controller install flow rules to forward DHCP packets
5. Done

## Project 6 Requirement - Workflow (2/7)

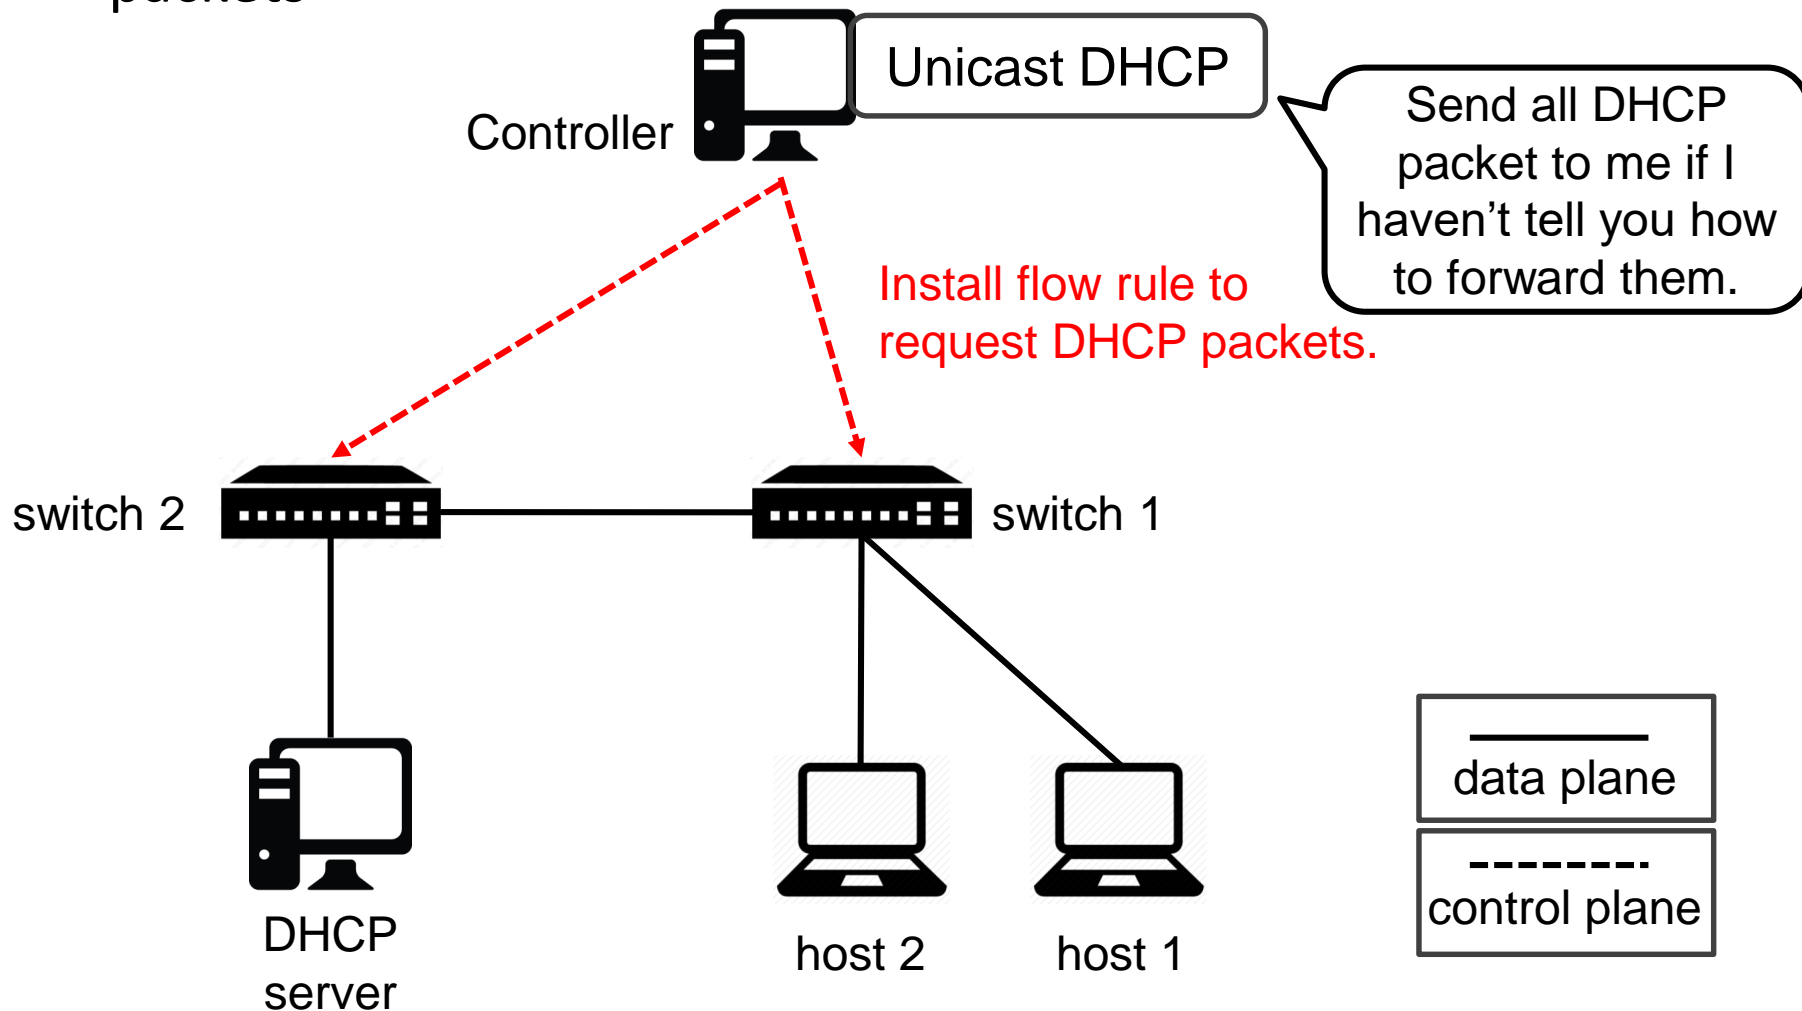

1. a. Network manager upload configuration file to ONOS

# Project 6 Requirement - Workflow (3/7)

1. b. Your application should install a flow rule to request DHCP packets

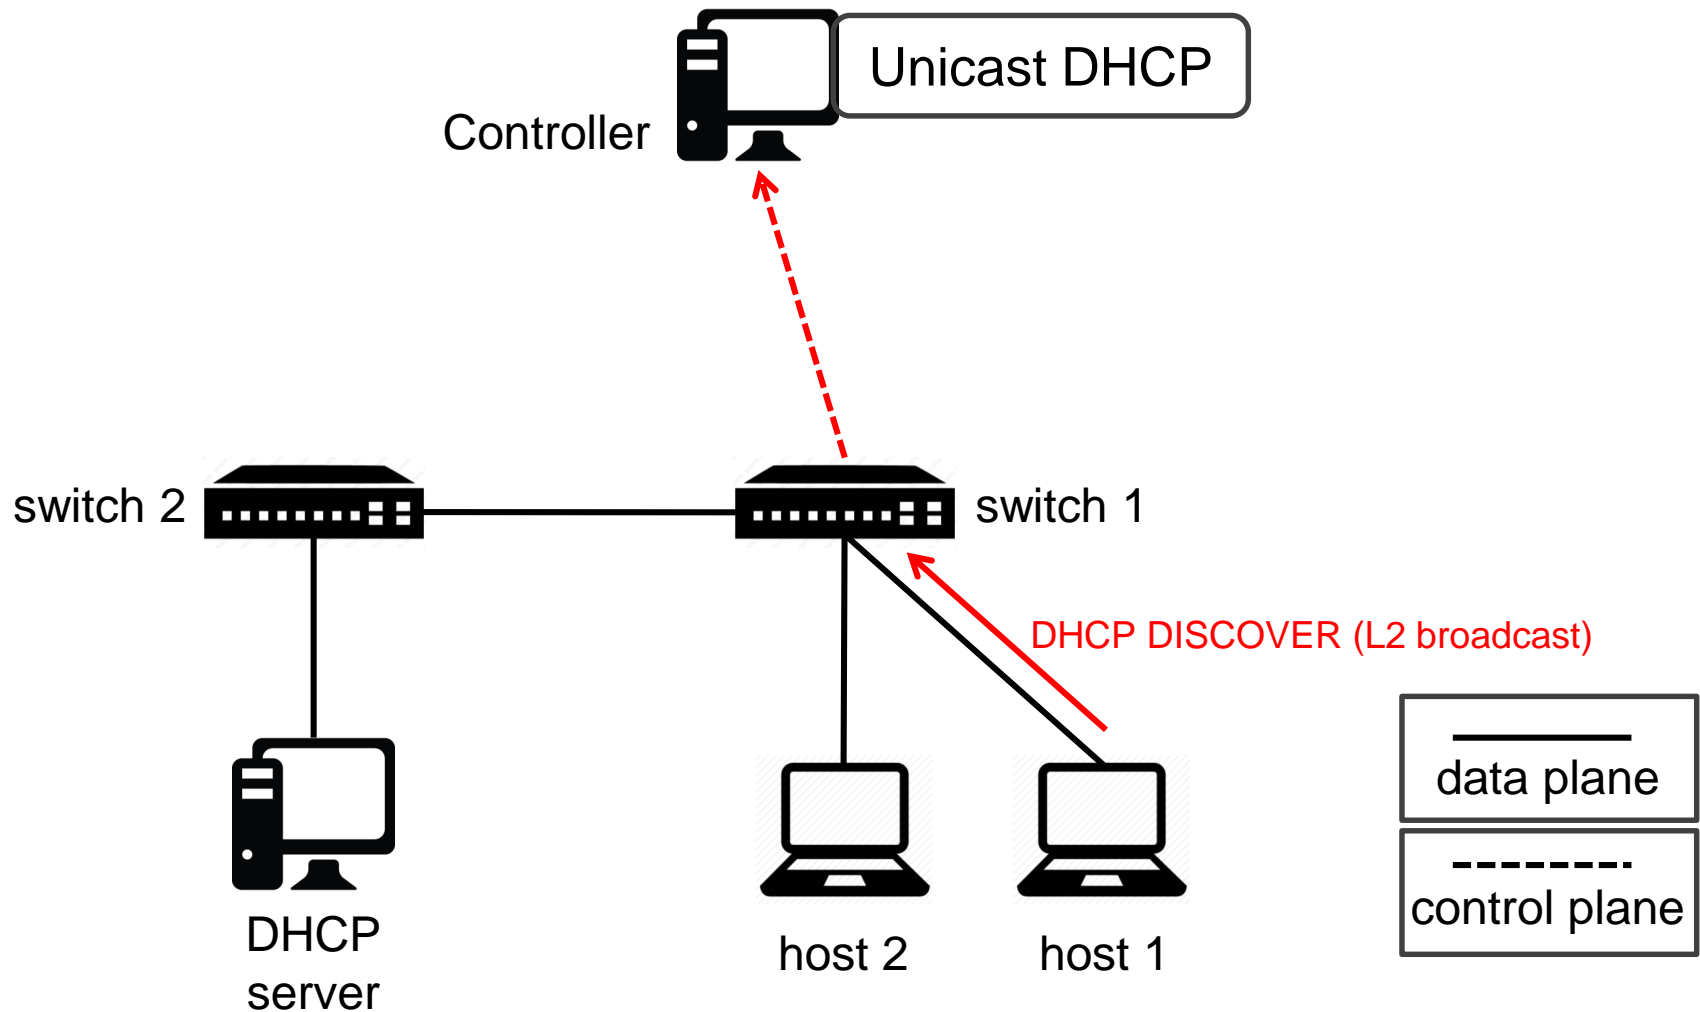

## Project 6 Requirement - Workflow (4/7)

2. DHCP DISCOVER will be packet-in to controller by switch

## Project 6 Requirement - Workflow (5/7)

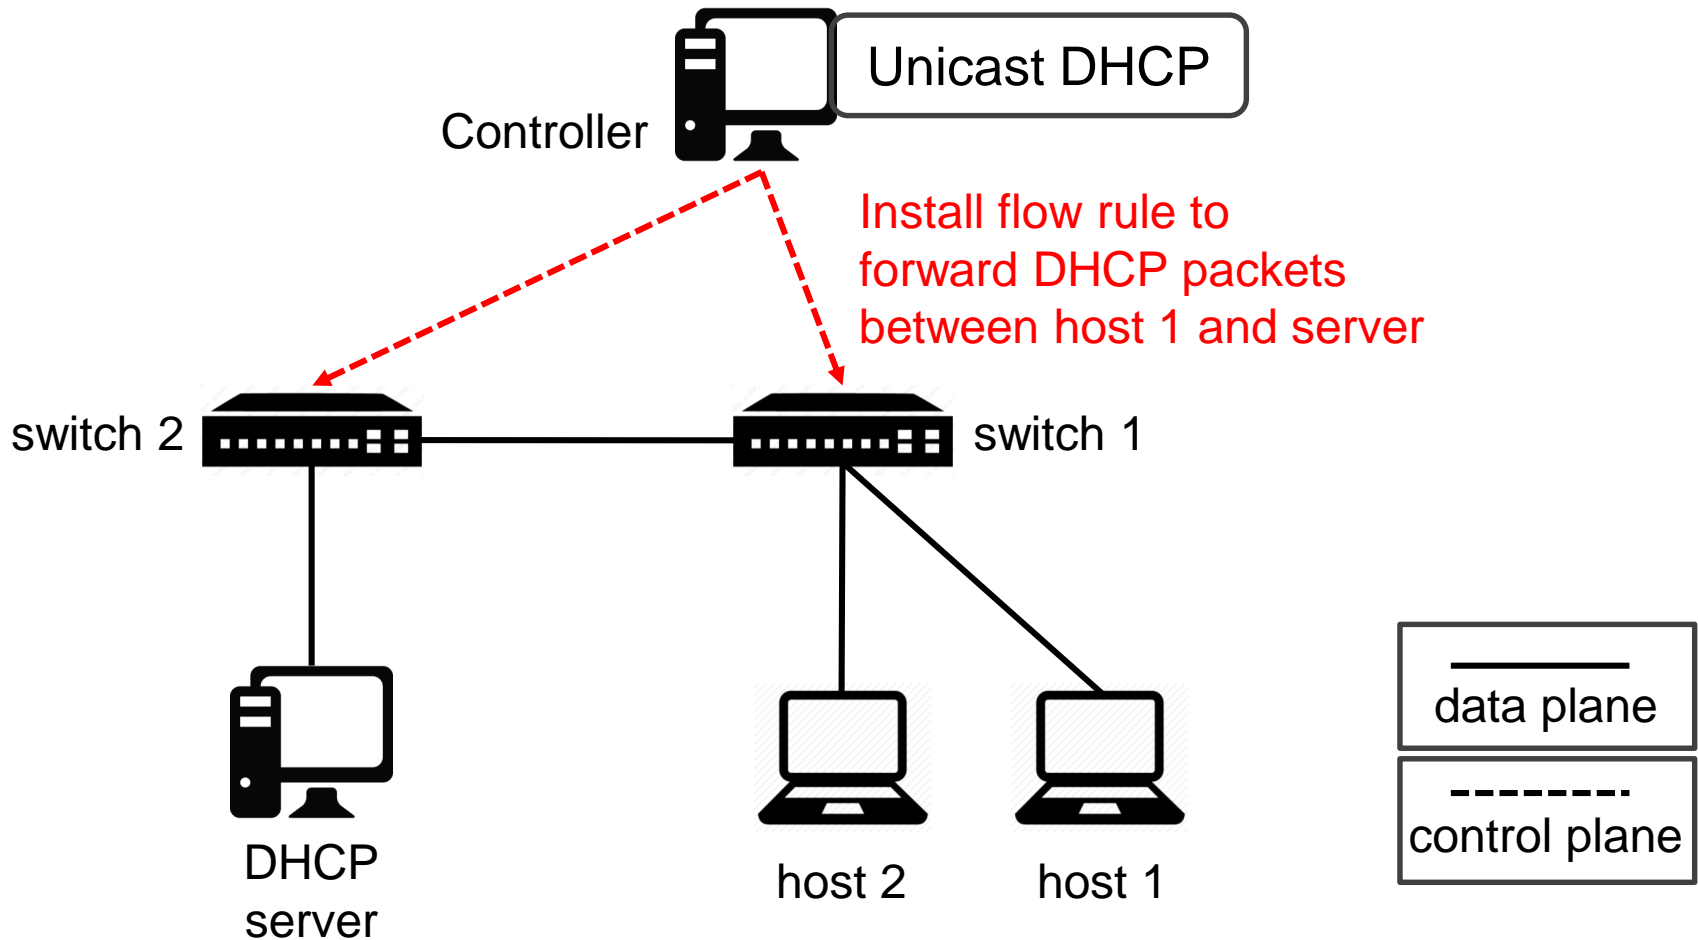

3. Controller compute path between DHCP client and server  
(Note: a bit like what you did in project 4)

## Project 6 Requirement - Workflow (6/7)

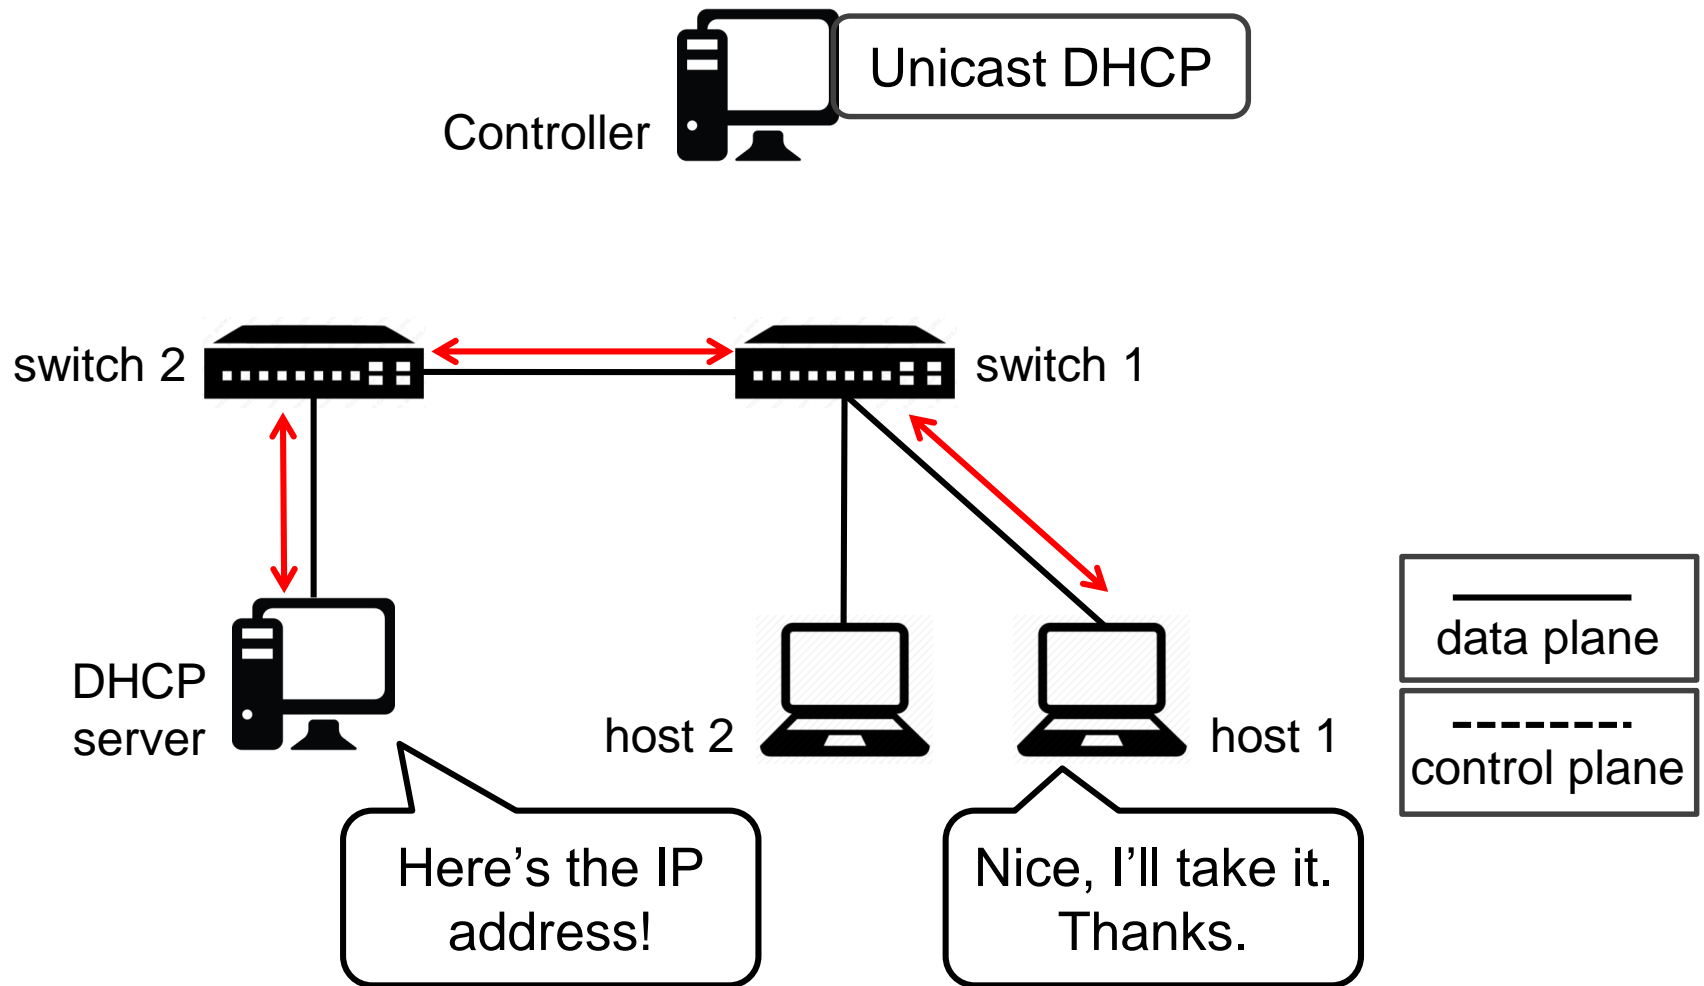

- Controller install flow rules to forward DHCP packets  
(Note: proactive and reactive forwarding are both acceptable)

# Project 6 Requirement - Workflow (7/7)

## 5. Done

# Project 6 Requirement - Provided File

□ “project\_6.zip” includes two directories and following files:

1. **EchoConfig**: (reference for ONOS users)

- EchoConfig is an example application that read configuration file through REST API and echo it to log file.
- Sample configuration file is also provided.
- This application is provided with ONOS version only.

2. **SDN-NFV-Project6**:

- a. **topo.py**: mininet topology
- b. **dhcpd.conf**: configuration file for mininet topology
- c. **unicastdhcp.json**: configuration file for unicast DHCP app (example for ONOS users)

# Project 6 Requirement - Topology

❑ The topology provided in "project\_6.zip" consist of:

- 3 switches
- 3 hosts
- 1 DHCP server

## Project 6 Requirement - Commands (1/2)

- ❑ Remember to install isc-dhcp-server before you start this project:

```
$ sudo apt-get install isc-dhcp-server
```

- ❑ To use dhcpcd, we should disable/modify AppArmor (only need to be done in the first time)

```
$ sudo ln -s /etc/apparmor.d/usr.sbin.dhcpd /etc/apparmor.d/disable/  
$ sudo apparmor_parser -R /etc/apparmor.d/usr.sbin.dhcpd
```

```
$ sudo /etc/init.d/apparmor stop  
$ sudo sed -i '30i /var/lib/dhcp{,3}/dhcpclient* lrw,'  
/etc/apparmor.d/sbin.dhclient  
$ sudo /etc/init.d/apparmor start
```

## Project 6 Requirement - Commands (1/2)

- ❑ Use following command to start the topology:

```
$ sudo python topo.py
```

- ❑ In mininet CLI, use following command to ask an IP for a host (which means to start an DHCP transaction):

```
mininet> h1 dhclient {interface_name}
```

## Project 6 Requirement - Configuring

❑ Use following command to upload a config file by REST API:

- For ONOS:

```
$ onos-netcfg {controller_IP} {json_file_name}
```

- For RYU:

– [https://osrg.github.io/ryu-book/zh\\_tw/html/rest\\_api.html](https://osrg.github.io/ryu-book/zh_tw/html/rest_api.html)

# Submit to e3

## ☐ Files

- All files of your application
- Config file you used in provided topology

## ☐ Submit

- Upload “.zip” file to e3
  - Named: **project6\_studentID.zip**
- Wrong file name or format would not be scored

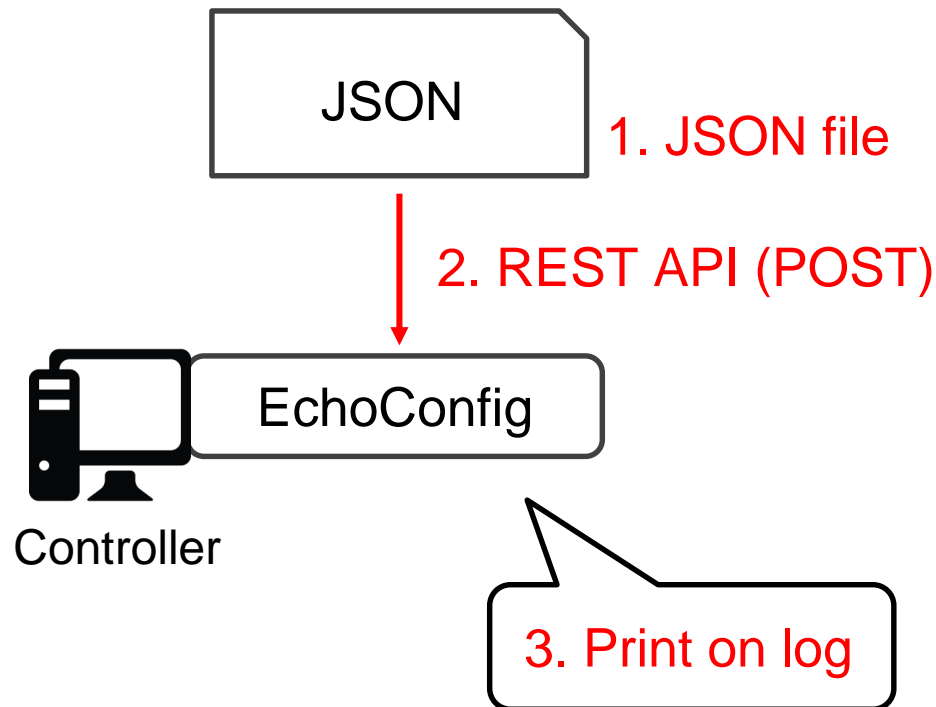

# Outline

- About DHCP
- Project 6 Requirements
- Hints
  - 1. EchoConfig

## Hints - EchoConfig

- ❑ EchoConfig is an example application that read configuration file through REST API and echo it to log file.
- ❑ We will explain this application for ONOS and RYU separately.

## Hints – EchoConfig ONOS version (1/2)

- ❑ Including:
  1. 2 source code files
    - AppComponent.java: main source code file for the application
    - MyConfig.java: the config class which will be imported in “AppComponent.java”.
  2. 1 sample config file
- ❑ Create your own EchoConfig application according to provided source code.
  - You may need to do some modification according to your package name.
- ❑ Compile your application and install into ONOS

## Hints – EchoConfig ONOS version (2/2)

- ❑ Check that the application title is correct in configuration file:

The screenshot shows the ONOS configuration interface on the left and a terminal window on the right. In the interface, the 'EchoConfig' application is highlighted with a red box. The terminal window shows the command `cat SimpleConfig.json` and its output, which is a JSON file. The 'EchoConfig' key in the JSON is also highlighted with a red box.

```
> cat SimpleConfig.json
{
  "apps": {
    "EchoConfig": {
      "myconfig": {
        "name": "Mike Perry"
      }
    }
  }
}
```

- ❑ Upload the config file
- ❑ The EchoConfig application will echo the config file in ONOS log:

The screenshot shows a log entry from the ONOS log. The log entry is: `2019-05-07 03:55:42,066 | INFO | ispatch-default0 | AppComponent | 190 - nctu.win.EchoConfig - 1.0.0.SNAPSHOT | Reconfigured, new name is Mike Perry`. The log entry is highlighted with a red box.

The screenshot shows a log entry from the ONOS log. The log entry is: `lt0 | AppComponent | Reconfigured, new name is Mike Perry`. The log entry is highlighted with a red box.
